AT&T Certifies SFI2 with DIVA and DDKI

Seattle, WA January 1, 2012

Complete network security: 1 dynamic framework and 1 dynamic protocol

Whitenoise Laboratories Inc. has received international attention because of its successful global patenting program and because of international standards organizations recognizing the benefits of secure networks.

AT&T, one of the world's largest telecommunications providers has now certified Secure File Interchange 2 for sale through their international developer and marketing channels. It is recognized as a critical solution for network security that is accessible by governments, SML businesses and consumers anywhere.

These solutions have been granted broad export permits by the appropriate government regulatory agencies that oversee the distribution of key based, national security level cryptosystems that contain key generation, key distribution and key management functionality.

Simple, secure and affordable network solutions will be available through AT&T marketing channels in Q1 2012.
